TIMOTHY FLETCHER

Security Analyst | Microsoft 365 · Microsoft Sentinel · Detection & Response · Infrastructure as Code
Remote · timfletcher.tech · linkedin.com/in/timcfletch · github.com/NotKornFlakes

SUMMARY

Help Desk Analyst at Upstate Medical University working account access, ticketed incidents and escalations in an SLA-driven healthcare environment. In my own Azure labs I monitor and triage Microsoft Sentinel alerts, write and tune KQL detections, set up log collection, and automate enrichment and containment through APIs. My portfolio site runs entirely on Cloudflare, managed in Terraform and deployed through GitHub Actions. Every investigation gets a write-up with evidence, metrics and lessons learned. B.A., Information Science; ISC2 Certified in Cybersecurity.

TECHNICAL SKILLS

SIEM & Security Ops: Microsoft Sentinel, KQL, Log Analytics, Logic Apps (SOAR), MITRE ATT&CK mapping, IOC triage, threat intel (AbuseIPDB, ThreatFox), honeypots (Cowrie, Endlessh), detection tuning, evidence preservation, incident write-ups

Cloud & DevOps: Cloudflare (Workers, R2, DNS, DNSSEC, TLS, rulesets), Azure (VMs, Storage, NSG rules, RBAC, managed identity, Azure Monitor Agent), Terraform, Wrangler, GitHub Actions, Checkov, gitleaks, Git

Systems & Identity: Windows, Linux (Ubuntu, Fedora), networking fundamentals, Active Directory, Microsoft 365 / Outlook, least privilege

Support & ITSM: Ticketing and queue management, incident documentation, escalation and handoff, remote troubleshooting, knowledge-base-guided resolution, phishing awareness, remediation tickets for resolver teams

Scripting & Reporting: KQL, Python (pandas, Plotly), SQL, REST APIs (Azure, AbuseIPDB), Sentinel workbooks, D3, Tableau, Excel

PROFESSIONAL EXPERIENCE

Help Desk Analyst, Upstate Medical University Oct 2025 – Present

- Provide Tier 1 support by phone and ticketing system, triaging and resolving hardware, software and account-access issues for clinical and admin staff.
- Administer Active Directory accounts and permissions and Microsoft 365 / Outlook access (calendar sharing, delegation) with least privilege.
- Document incidents and fixes in the system of record, work my own ticket queue, and close tickets within SLA targets.
- Escalate complex cases to resolver teams with initial findings and clear handoff notes; flag repeat issues for the knowledge base.

Owner, Self-Employed Home Repair & Remodeling Jan 2021 – Sep 2025

- Handled all client communication, scheduling and on-site diagnosis myself while finishing a B.A. in Information Science full-time.

Project Estimator / Coordinator, TPM General Contractors & Property Restoration Jan 2019 – Jan 2021

- Built insurance claim estimates in Xactimate and tracked schedules and progress across contractors and clients in Excel.

SECURITY & CLOUD PROJECTS

SOC Home Lab: Azure Honeypots + Microsoft Sentinel GitHub

- Deployed three honeypots (Windows RDP, Cowrie SSH, Endlessh) and configured Azure Monitor Agent, data collection rules and a custom log table to feed Sentinel; captured 1.24M attack attempts from 75 IPs in 37 hours with zero compromises.
- Wrote 5 KQL analytics rules (including password spray and brute-force-then-success), tested coverage, and rebuilt the low-and-slow rule after v1 missed an attacker guessing once every 12 minutes.
- Reconstructed an SSH intrusion chain from session logs, mapped 13 techniques to MITRE ATT&CK, quarantined 13 captured attacker files and identified Panchan, Mirai and Bashlite by hash; published defanged IOCs and a D3 dashboard.

Sentinel SOAR: Automated Brute-Force Response GitHub

- Built and troubleshot a Logic App playbook tying Sentinel, the AbuseIPDB API and the Azure REST API together to enrich incidents and auto-block high-risk IPs in an NSG, using a least-privilege managed identity.
- Cut triage to about 12 seconds on average (8–18 s) versus 10–15 minutes by hand; blocked IPs made zero further attempts, and per-IP grouping reduced 65 alerts to 6 incidents (~91%).

Portfolio Site: Infrastructure as Code on Cloudflare (Terraform, Workers, R2, GitHub Actions) GitHub

- Moved the site off Azure onto Cloudflare Workers static assets with a custom domain, which removed the origin server and the path that let traffic skip Cloudflare; disabled the workers.dev route.
- Manage DNS, DNSSEC, strict TLS, HSTS, security headers and email records (null MX, SPF, DKIM, DMARC) in Terraform with remote state in R2; imported 11 live resources so the follow-up plan showed zero changes.
- GitHub Actions scans every push with Checkov and zizmor, plans on pull requests, and applies on merge behind a production approval gate. 21 automated checks then verify the live site from outside, and a weekly run catches config drift.
- Audited my own setup: gitleaks clean across full git history, zero personal access tokens, and no metadata in published files.

HHS Healthcare Breach Analysis (Python, pandas, Plotly) GitHub

- Cleaned and analyzed 8,013 HHS OCR breach records (2009–2026), showing hacking grew to 81% of breaches by 2025; published a live dashboard and a security-budget memo for a 40-person clinic.

CERTIFICATIONS & EDUCATION

ISC2 Certified in Cybersecurity (CC) · TestOut Security Pro Jul 2025

B.A., Information Science, State University of New York at Oswego 2024

Coursework: cybersecurity, networking, systems analysis, databases. Ongoing TryHackMe labs (networking, Linux, defensive security).
